

Dojo Challenge

03 Times Table Generator

Level: **Beginner** / Intermediate / Expert

Goal

Your program will print out the times table chosen by the user.

When you program runs, ask the user for a number that will be the times table to create.

Your output will then be a times table up to 12 times.

Example run of program:

```
Hello, what times table do you want? 7
```

```
1 x 7 = 7
```

```
2 x 7 = 14
```

```
3 x 7 = 21
```

```
...etc.
```

Once you have that working, add a second question that says “How many results do you want?” and then change your program so that if they say 100 (for example), it will print out the times table with 100 entries, not just 12.

Skills Required

- Input
- Loops
- Formatting print
